

Who Am I is a local tool that automatically collects and standardizes the data you generate across your devices and apps giving you a single, usable record of your digital life.

Team | Martin Gómez-Pablos (), Taro Honjo (thonjo.ieu2025@student.ie.edu)

Problem & Propositions |

- (1) People constantly generate data, and consequently value. This value is completely lost to the individual generating the data.
- (2) As the [scarcity of human generated data](#) increases, it's value will increase.
- (3) Centralizing and standardizing personal data increases its value and useability long term.
- (4) As the source of data, it should theoretically be the most efficient (and ethical) to gather data on yourself. In reality, individuals lack the tools to do so.

Solution | A system that aggregates, standardizes and manages data generated by the user. This allows for personal data to be stored as an asset that increases in value. The goal is to create a format that allows for flexible use of the data (more uses, more value).

To Build |

- (1) The core data accumulator and plugins.
 - A program that monitors activity on a device to accumulate data.
 - Plugins that connect to sources of data.
e.g. Gmail, photo library, keyboard input (writing style),
 - CLI version
ex. “whoami install location-data” to install location data accumulation package,
‘whoami track location-data’ to start accumulating location data.
 - App version. UI for convenience and accessibility.
- (2) Proof of concept add-ons. Ways to leverage accumulated data.
Note that this is not necessarily part of our product, we just want to show possible ways to leverage self-owned data i.e., ideas that our project will enable.
 - Opt-in marketplace that allows the owner of the data to get paid for access to their data.
 - Personalized AI app that impersonates user based on the data.

Notes |

Target customer – depends on the add-ons that we choose to focus on. Although they are not the core of our product, they are what the customer (and the jury) will see.
